## 1. OVERVIEW

### 1.1. FUNCTIONS

## Switch output function:

The following functions are applicable to each output channel (see table below). The number of channels depends on the product design.
For example: 1, 2, 3 channel. The channel can set three different states:

## Prohibition (No Active)

The channel does not work, the channel related objects are not visible in the ETS;

## Switch (Switch)

The channel work is in the switching mode, and there are various parameters to control the processing mode of the switch.

## Staircase (Staircase)

The channel works in the corridor lighting mode, and the difference between the switching mode and the switch mode is that the channel will be closed automatically after working to a set time.

## General interface functions:

The following functions are applicable to all common interface channels.
Additionally, two logical functions are supported.
The corresponding functions of each channel are as follows:

## disabled

This option indicates that the current channel has no function and does not respond to it;

## enabled

This option represents the current channel to enable relevant functions;

## Channels grouped

This option indicates that two adjacent channels are used as a combination;

## Channels unique

This option indicates that two adjacent channels are used independently;

## Overview functions:

Switch output function preview table:

| Group of functions | Functions |
| :---: | :---: |
| Group addresses | number of objects/connections= <br> dynamic (freely assignable of the user) |
|  | behavior at bus power up |
|  | startup timeout |

General interface function preview table:

| Debounce time | 10-120ms, selectable in steps |
| :---: | :---: |
| Time for keystroke long | 0,1-30s, selectable in steps |
| Enter the internal pull | Able/Forbid |
| Double key dimming function | Dim |
| Double key shutter function | Up/Down |
| Double key switch function | Power on/Power off |
| Single key switch function | Switch function |
|  | Toggle function |
|  | State function |
|  | Delay function |
|  | Edge delay sending function |
|  | Mandatory setting function |
|  | Sending value function |
| Scene function | memory function |
|  | Scene selection |
| Counter function | Edge delay detection |
|  | Step threshold settin |
| Switch short/long | On-/Off-/toggle function |
|  | short/long independent parameterize able |
| One button dimming | steps of dimming telegram repetiti |
| One button shutter | shutter function with only one button |
| Logic functions AND-function | switching function |
|  | scene function |
|  | inverting |
| Logic functions: OR-function | switching function |
|  | scene function |
|  | inverting |

## 2. COMMUNICATION OBJECTS

| Numi Name |  | Object Function | Description Group Address | Length | C | R | W T | $u$ | Data Type | Priority |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| \% ${ }^{0}$ | Channel A | Switch On/Off |  | 1 bit | c | W | w | - | switch | Low |
| W+ ${ }^{\text {2 }}$ | Channel A | Block |  | 1 bit | c | W | W - | - | enable | Low |
| \#+4 | Channel A | Scene |  | 1 byte | c | w | w | - |  | Low |
| - ${ }_{\text {+ }}{ }^{\text {5 }}$ | Channel A | State |  | 1 bit | c | R - | - | - |  | Low |
| \#+ ${ }^{\text {6 }}$ | Channel A | Logic 1 |  | 1 bit | c | W | w | - | boolean | Low |
| W+ ${ }^{\text {+ }}$ | Channel A | Logic 2 |  | 1 bit | $c$ | W | W - | - | boolean | Low |
| 『+ ${ }^{\text {¢ }}$ | Channel A | Response operating hours |  | 2 bytes C | c | R - | - T | - |  | Low |
|  | Channel A | Reset operating hours |  | 1 bit | c | w | w | - | switch | Low |
|  | Channel B | Staircase |  | 1 bit | c | w | w . | - | switch | Low |
| - $\mathbf{F}^{2}$ 20 | Channel B | Block |  | 1 bit | $c$ | w | W - | - | enable | Low |
| $\cdots \overrightarrow{123}$ | Channel B | State |  | 1 bit | c | R | T | - |  | Low |
| - 4 + 26 | Channel B | Response operating hours |  | 2 bytes $C$ | c | R - | - ${ }^{\text {T }}$ | - |  | Low |
| $\stackrel{\square}{+3} 27$ | Channel B | Reset operating hours |  | 1 bit | c | W | W - | - | switch | Low |
|  | Central function | Switch On/Off |  | 1 bit | c |  |  | - | switch | Low |

Communication below shows the channel generic objects, they can through the corresponding parameters can make. Each channel takes up 18 number, but not necessarily all number will allocate objects. The first channel takes up Numbers 0-17, 18-35 and so on. The second takes design engineering need to use when object allocation group address.
The following figure shows some objects of channel $A$ and $B$. In which channel A is selected as the normal switch, with logic and locking function. Channel B is selected as the corridor lighting, with locking function:

The following communication objects can be shown for a channel selected as switch:

| Nr. | Function | Usage | Data |  |
| :---: | :---: | :---: | :---: | :---: |
| 0 | Switch on/off | switches the channel on/off | DPT 1.001 | In, Write |
| 2 | Block | blocks the channel | DPT 1.001 | In, Write |
| 4 | Scene | calls activated scenes | DPT 18.001 | In, Write |
| 5 | Status | feedback function | DPT 1.001 | Out, Read |
| 6 | Logic 1 | only shown at activated logic <br> function | DPT 1.001 | In, Write |
| 7 | Logic 2 | only shown at activated logic <br> function | DPT 1.001 | In, Write |
| +8 | next channel |  |  |  |

The following communication objects can be shown for a channel selected as staircase:

| Nr. | Function | Usage | Data |  |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Staircase | switches the staircase function <br> on/off | DPT 1.001 | In, Write |
| 2 | Block | blocks the channel | DPT 1.001 | In, Write |
| 5 | Status | feedback function | DPT 1.001 | Out, Read |
| +8 | next channel |  |  |  |

### 2.1. COMMUNICATION OBJECTS CURRENT MEASUREMENT

The following communication objects are available for the current measurement and counting of the operating hours:

| Nr. | Function | Usage | Data point type |  |
| :---: | :---: | :---: | :---: | :---: |
| 8 | Response <br> operating hours | reports counted operating <br> hours | DPT 7.007 | Out, Read |
| 8 | Time to the next <br> service | reports time to the next <br> service | DPT 7.007 | Out, Read |
| 9 | Reset operating <br> hours | resets counter for the <br> operating hours | DPT 1.001 | In, Write |
| 9 | Reset service | resets the counter for the <br> service time | DPT 1.001 | In, Write |
| 10 | Service required | reports required <br> maintenance | DPT 1.001 | Out, Read |

### 2.2. CENTRAL COMMUNICATION OBJECT

The total control object is valid at any time. And there is only one in the whole project. The number is related to the number of channels. The communication of the total control object will be valid for all channels that enable the total control function.

| Nr. | Function | Usage | Data type |  |
| :---: | :---: | :---: | :---: | :---: |
| 78 | Central function | Open/close all channels <br> that enable the total control <br> function | DPT 1.001 | In, Write |

2.3. DEFAULT SETTINGS OF THE COMMUNICATION OBJECTS

The following chart shows the default settings for the communication objects:

| Default settings |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| NO. | Channel/Input | Function | Length | Priority | C | R | W | T | U |
| 0 | Channel A | Switch on/off | 1 Bit | Low | $\times$ |  | $\times$ |  |  |
| 1 | Channel A | stairway | 1 Bit | Low | $\times$ |  | $\times$ |  |  |
| 2 | Channel A | Locking | 1 Bit | Low | $\times$ |  | $\times$ |  |  |
| 4 | Channel A | Scene | 1 Bit | Low | $\times$ |  | $\times$ |  |  |
| 5 | Channel A | Condition | 1 Bit | Low | $\times$ | $\times$ |  | $\times$ |  |
| 6 | Channel A | Logic 1 | 1 Bit | Low | $\times$ |  | $\times$ |  |  |
| 7 | Channel A | Logic 2 | 1 | Low | $\times$ |  | $\times$ |  |  |
| 8 | Channel A | Working time counter | 2 Byte | Low | $\times$ | $\times$ |  | $\times$ |  |
| 8 | Channel A | Next service time | 2 Byte | Low | $\times$ | $\times$ |  | $\times$ |  |
| 9 | Channel A | Reset counter | 1 Bit | Low | $\times$ |  | $\times$ |  |  |
| 9 | Channel A | Reset the next service time | 1 Bit | Low | $\times$ |  | $\times$ |  |  |
| 10 | Channel A | Service request | 1 Bit | Low | $\times$ | $\times$ |  | $\times$ |  |
| +18 | Next input |  |  |  |  |  |  |  |  |
| 78 | Global function | on/off | 1 Bit | Low | $\times$ |  | $\times$ |  |  |

You can see the default values for the communication objects from the upper chart. According to requirements the priority of the particular communication objects as well as the flags can be adjusted by the user. The flags allocates the function of the objects in the programming thereby stands $C$ for communication, R for Read, W for write, T for transmit and U for update.

### 2.4. ONLINE STATE OBJECT

The online status object indicates that the device is running normally on the bus and actively sending the status.

| Nr. | Function | Usage | Data type |  |
| :---: | :---: | :---: | :---: | :---: |
| 79 | Online | Active sending device online <br> status | No | Out, Read |

### 2.5. THE OBJECT OF THE GENERIC INTERFACE CHANNEL

Each channel has its corresponding five object Numbers, which in turn are channel
A: 80-84; Channel B: 85-89; Channel C: 90-94; Channel D: 95-99;
The object location will be permanently occupied and will not change due to schema changes.
These are the available objects for each channel:

| Nr. | Function | Usage | Data type |  |
| :---: | :---: | :---: | :---: | :---: |
| 80 | Switch | edge control | DPT 1.001 | Out, Read |
| 80 | Send forced setting | force control/switch | DPT 2.001 | Out, Read |
| 80 | Shutters down/up | driving of shutters | DPT 1.008 | Out, Read |
| 80 | Dimming on/off | toggling of the dimming lights | DPT 1.001 | Out, Read |
| 80 | Switch on/off | two button switching | DPT 1.001 | Out, Read |
| 80 | Reset counter | reset the counter value | DPT 1.001 | In, Write |
| 80 | Send value | sends the parameterized value | DPT 5.001 | Out, Read |
| 80 | Push button short | sends action for short keystroke | DPT 1.001 | Out, Read |
| 81 | Value for toggle | edge control with toggle function | DPT 1.001 | In, Write |
| 81 | Stop/Blinds open/close | driving of the blinds/ stopping movement of the shutters | DPT 1.009 | Out, Read |
| 81 | Dimming | dimming | DPT 3.007 | Out, Read |
| 82 | Scene | scene control | DPT 18.001 | Out, Read |
| 82 | Value for change of direction | reversal of direction for shutters | DPT 1.001 | Out, Read |
| 82 | Push button long | sends action for long keystroke | DPT 1.001 | Out, Read |
| 83 | Counter | counting | DPT 12.001 | Out, Read |
| 84 | Blocking object | blocks the related channel | DPT 1.001 | In, Write |
| +5 | Next channel |  |  |  |
| 122 | LED output A | turn LED | DPT 1.001 | Out, Read |

### 2.6. COMMUNICATION OBJECTS LOGIC

Each device has two logical function, each logical function is equipped with two logical input object, a logic output object, and you can choose any channel to participate in the logical operation, end object Numbers from 110 to 110.
The following communication objects for the logic can be shown:

|  | Nr . | Function | Usage | Data type |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 110 | Logic input 1A | Logic input | DPT 1.001 | In, Write |
|  | 111 | Logic input 1B | Logic input | DPT 1.001 | In, Write |
|  | 112 | Logic input 1 | Logic input | DPT 1.001 | Out, Read |
|  | 112 | Logic output 1 Scene | Logic output scene | DPT 18.001 | Out, Read |
|  | 112 | Logic output 1 Value | Logical 1 output value | DPT 5.010 | Out, Read |
|  | 113 | Logic input 2A | Logical 2 input A | DPT 1.001 | In, Write |
|  | 114 | Logic input 2B | Logic 2 input B | DPT 1.001 | In, Write |
|  | 115 | Logic output 2 | Logical 2 output | DPT 1.001 | Out, Read |
|  | 115 | Logic output 2 Scene | Logical 2 output scenario | DPT 18.001 | Out, Read |
|  | 115 | Logic output 2 Value | Logical 2 output value | DPT 5.010 | Out, Read |
| - $\vec{F}^{+110}$ | Logic | Input 1 A | 1 bit | c - WT U | boolean Low |
| - $\vec{H}^{1} 111$ | Logic | Input 1 B | 1 bit | c - WT U | boolean Low |
| - $\vec{H}^{\text {\| }} 112$ | Logic | Output 1 | 1 bit | $C$ R - T | switch Low |
| - $\overrightarrow{-1}^{1} 113$ | Logic | Input 2 A | 1 bit | c - WT U | boolean Low |
| - $\vec{H}^{\text {\| }} 1114$ | Logic | Input 2 B | 1 bit | c - WT U | boolean Low |
| $\stackrel{\text { F\|l\|l }}{ } 115$ | Logic | Output 2 | 1 bit | C R . | switch Low |

ARLIGH

## 3. REFERENCE ETS - PARAMETER

### 3.1. GENERAL SETTINGS

The following figure is the global parameter:

| Startup timeout |  | 1 s |  |  | - |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Send "In operation" object |  | No |  |  | - |
| Mode of functioning of inputs |  | - inputs acting on switching outp. (IA->OA...inputs acting separately on bus |  |  |  |
| Signal control of the inputs |  | push button (rising $=$ TOGGLE; falling $=\cdots$ - |  |  | - |
| Debounce Time [ms] |  | 30 ms |  |  | * |
| Time for keystroke long [s] |  | 0,8 s |  |  | - |
| Behavior of status response(Output) |  | after change |  |  | - |
| Inputs Type | nly used to input pins) |  | DisablePullup | - EnablePullup |  |
| Behaviour at Bus power up(Input) |  |  | No read value | or toggle |  |
|  |  |  | Read value for | toggle |  |
| The following table parameters: |  |  |  |  |  |
| ETS-text | Dynamic range [default value] |  | comment |  |  |
| Startup timeout | $\begin{gathered} 1-60 \mathrm{~s} \\ {[1 \mathrm{~s}]} \end{gathered}$ |  | After the tim the device w <br> The ap | out parameter is star its for the parameter plication function is va |  |

The General Settings:

| Send "In operation" object | No <br> Send value "0" cyclic <br> Send value "1" cyclic | Send the "In operation" object to the bus reporting device to run normally, and the periodic send value can be selected " 0 " or " 1 ". |
| :---: | :---: | :---: |
| Send cycle time in s[1... 65535] | $\begin{gathered} 1-65535 \mathrm{~s} \\ {[60]} \end{gathered}$ | Send the "In operation" object cycle time setting. |
| Mode of functioning of inputs | Inputs acting on switching outp. (IA->OA/IB->OB/IC->OC) <br> Inputs acting separately on bus | Signal input function mode selection, optional signal input directly ACTS on the output channel (local control), or signal input ACTS as binary input on the bus |
| Signal control of the inputs | $\begin{gathered} \text { push button } \\ \text { (rising = TOGGLE; falling =---) } \\ \text { switch } \\ \text { (rising }=\text { ON; falling =OFF) } \\ \text { switch (rising }=\text { TOGGLE; } \\ \text { falling }=\text { TOGGLE) } \end{gathered}$ | When selecting the signal input directly acting on the output channel (local control), the control function of the input signal can be selected. |
| Debounce time | $\begin{gathered} 10-120 \mathrm{~ms} \\ {[30]} \end{gathered}$ | Signal input buffeting time, optional $10 \mathrm{~ms}, 30 \mathrm{~ms}, 60 \mathrm{~ms}$ and 120 ms |
| Time for keystroke long | $\begin{gathered} 0.1-30 \mathrm{~s} \\ {[0.8 \mathrm{~s}]} \end{gathered}$ | Long button determination time (longer button when the value is greater than the value), it is necessary to determine the value when the length key is distinguished. |
| Behavior of status response(Output) | after change always no, updated only | Output channel switching state response condition, can choose "send after change", "always send" or "do not send, only update state" |
| Input Type Ionly used to input pins) | Disable Pullup Enable Pullup | Select "no pull-up" or "enable pull-up" in the input channel. |
| Behavior at bus power up | No read value for toggle Read value for toggle | Whether the rollover value is read when the device is reset, default is 0 . |

## INPUT PARAMETER DESCRIPTION:

Mode of functioning of inputs.
The concealed switch actuator is equipped with 3 extended inputs, whose functions depend on the parameterized configuration:

1. It can be directly applied to the switching output (local control);
2. As binary input on the EIB/KNX bus.

## Inputs acting on switching out. (IA->OA/IB->OB/IC->OC)

In local control mode, the input $A(1)$ on the channel output, $A$ type $B(2)$ on the output channel B, type C (3) the effect on the output channel C and type D (4) no effect. According to the parameter "Signal control", Signal operation can be defined. The output response of the relay is shown in the following table:

| Signal edge control | The input contact | Model | Relay switching <br> status |
| :---: | :---: | :---: | :---: |
| push button <br> (rising = TOGGLE; <br> falling =---) | Close (up edge) <br> Open (down edge) | Normally open/normally <br> closed | Normally open/normally <br> closed | | Contact toggle* |
| :---: |
| No action |

* The object value of the toggle object is flipped, the normally open contact (n.o.) is closed at " 1 " and opened at " 0 ", and the normally closed contact (n.c.) is closed at " 0 " and opened at " 1 ".

For direct local control, the extended input does not have its own parameters, so the input parameter record is invalid

## Inputs acting separately on bus

The input signal of the switch actuator is independent of the switch output and independent of the EIB/KNX bus.
According to the parameters configuration, each input can be configured "switch", "short press/long press button", "a single bond that move light", "a single bond curtain control" and "counter" and "scene" function, when choosing the "no function", then the corresponding input function have been banned.
When selecting "switch" function, extended object can be through the group address associated with the object of the switch output, therefore, switch actuator can also use your own input signal through the role to bus control actuator output (such as a few actuator control group).

Input Type(only used to input pins)

The switch actuator extension input can be configured to enable internal pull-up or to disable internal pull-up function. In order to be compatible with passive signal input and active signal input, it is to enable internal pull-up function by default.

## Disable Pullup

Internal pull-up function is prohibited, input signal is high level effective, dry contact input, high level input effective range is 3.3V~24VDC;

## Enable Pullup

Enable internal pull-up function, input signal is low level effective, dry contact input, low level input is lower than IVDC positive level signal, and is compatible with OC gate input.

A RLIGHT

### 3.2. CHANNEL SELECTION

The following figure shows the channel selection menu:

| Channel A | Switch | - |
| :--- | :--- | :--- |
| Channel B | Staircase |  |
| Channel C | No Activ | * |

There are three different modes to choose from. Each mode has corresponding parameters. "not active" means no pass-through, and the corresponding channel parameters will not be visible.
The following figure shows the optional patterns for each channel:

| ETS-Name | Dynamic range [default value] |  | Remark |
| :---: | :--- | :--- | :--- |
| Channel A-B-C | not active <br> Switch | Staircase | Channel mode |

### 3.3. GENERAL PARAMETERS

The following parameters are used for both the switching function of the channel and the stair function.

### 3.3.1.THE WORKING MODE OF THE RELAY IS SHOWN

 IN THE FOLLOWING FIGURE:

The following figure shows the relay in normally open and normally closed mode, and the signal message is alternate 1,0 .

### 3.3.2. GENERAL CONTROL FUNCTION

The following table shows the range of global function parameters:

| Name | Dynamic range [default value] | Remark |
| :---: | :---: | :---: |
| Central function | not active <br> active | Enable/disable the corresponding <br> channel of General control function |

Each channel can be individually enabled ("active")//["not active") the general control function, when send a message to general control objects, all the function of general control channels will be switched according to the message content, and delay the time delay of parameter Settings are equally effective. The use of general control function can make engineering design more convenient, because multiple channel send a single message can response at the same time.
The following table illustrates general control objects

| Number | Length | Usage |
| :---: | :---: | :---: |
| Central function | 1 Bit | The number of objects under control depends on the <br> number of channels |

### 3.3.3. LOCK/UNLOCK BEHAVIOR

Below is a screenshot of the lock and unlock options in ETS
Behaviour when locked

Behaviour when unlocked

| Off |  |
| :--- | :--- |
| On |  |

The following table is optional for locking and unlocking parameters:

| Name | Dynamic range [default value] | Remark |
| :---: | :---: | :---: |
| Behavior when locked | On |  |
| Off |  |  |
| Behavior when unlocked | no change | Set blocking |
|  | and nonblocking actions |  |

Lock and unlock function can make and banned by sending a message to the appropriate object 1 or 0 . Parameters "behaviors when locked" is used to define. When the channel lock relay action, the options are "on", "off", "no change". The same option applies to the parameter "behaviors when unlocked ".

The following table shows the description of the lock/unlock object:

| No. | Name | Length | Use |
| :---: | :---: | :---: | :---: |
| 2 | Block | 1 Bit | blocks the channel |

The stated when the locking and unlocking relay action state, concrete action by the parameter "behaviors when locked" and "behaviors when unlocked" specified:

### 3.3.4. POWER ON/OFF

The following figure shows the options for the power on/off parameters in ETS:

The following table shows the range of power on/off parameters:

| ETS-Name | Dynamic range [default value] | Remark |
| :---: | :---: | :---: |
| Behavior at bus power up/ | On |  |
| Off |  |  |
| Behavior at bus power down |  |  |

Device is powered on or power off each channel can be action to a specified state (option on and off), of course, can also maintain the current state of the same options (no change). Considering the bus cannot continues to control the channel status, when the power is set designers should think carefully about the parameter.

### 3.4. SWITCH OUTPUT

Some of the following parameters are available only when the channel is selected for switch mode.

### 3.4.1. OVERVIEW

When Channel A is selected as the Switch function, A sub-menu called Channel A Switch will appear accordingly.
The following is a screenshot of the submenu:
Channel A Switching

| Mode | normaly closed | - |
| :---: | :---: | :---: |
| On Delay [s] | 0 | - |
| Off Delay [s] | 0 | - |
| Central Function | activ | $\checkmark$ |
| Behaviour when locked | Off | - |
| Behaviour when unlocked | On | - |
| Behaviour at Bus power up | no change | - |
| Behaviour at Bus power down | no change | - |
| Logical functions | with two Objects | $\checkmark$ |
| logic Operations | OR | - |
| Szene | activ | $\bullet$ |

The following table shows the parameters available for the channel as a switch function:

| Name | Dynamic range [default value] | Remark |
| :---: | :---: | :---: |
| Mode | normally opened normally closed | Channel working mode. |
| On-Delay | $\begin{aligned} & 0 . . .30000 \mathrm{sec} \\ & {[0=\text { no delay] }} \end{aligned}$ | Wait delay before opening the relay. |
| Off-Delay | $\begin{aligned} & 0 . . .30000 \mathrm{sec} \\ & {[0=\text { no delay }] \text { ] }} \end{aligned}$ | Wait delay before closing the relay. |
| Central function | not active active | Activate the global control function of the channel. |
| Behavior when locked | Off On no change | Specifies the action when the channel is locked. |
| Behavior when unlocked | Off <br> On no change | Specifies the action to unlock the channel. |
| Behavior at bus power down | Off <br> On no change | Specifies the action of the bus when it loses power. |
| Behavior at bus power up | Off <br> On no change | Specifies the action when the bus is energized. |
| Logic function | not active with one object with two objects | Enable/disable logical functions. |
| Logic operation | And Or | Select logical operations and/or. |
| Scene | not active active | Activate the scene function. |

### 3.4.2. ON/OFF DELAY

The following figure shows the Settings in ETS:

| OnDelay $[\mathrm{s}]$ | 0 |  |
| :--- | :--- | :--- |
| Off Delay [s] | 0 | 0 |

After receiving the open message, the channel will Delay the time specified by the parameter "On Delay", and then actually perform the open action.
The following figure describes the effects of two parameters:

### 3.4.3. LOGIC FUNCTION

The following figure shows the options in ETS:

```
Logical functions
```

Logic functions, there are two logical objects can be enabled, and you can choose "and" or "or" operation. When enabled "and" operation, the logical value of the object to the value of the object and the channel "and" operation, the result is 1 when the opening action. When enabled "or" operation, the logical value of the object to the value of the object and the channel "or" operation, as long as there is an object value is 1 , will execute open action.

The following table illustrates two logical objects:

| NO. | Name | Length | Use |
| :---: | :---: | :---: | :---: |
| 6 | Logical objects 1 | 1 | When only one logical object is enabled, <br> the object is used |
| 7 | Logical objects 2 | 1 | When enabling two logical objects, <br> the object is used |

According to enabled logical objects, only one or two logical objects are valid.
The following table illustrates the relationship between logical objects:

| Logic 1 | Logic 2 | Is the channel open? | Logic 1 | Logic 2 | Is the channel open? |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | No | 0 | 0 | N |
| 0 | 1 | N | 0 | 1 | Y |
| 1 | 0 | N | 1 | 0 | Y |
| 1 | 1 | Y | 1 | 1 | Y |

### 3.4.4. SCENE FUNCTION

When have different functions (such as: turn on the light, dimmer, shutter door) need to be processed at the same time, you usually have to separate message to each of the objects to completion. But there is A scene, it can greatly simplify, usually only need to send A message to invoke A scenario can complete all of the above functions. Than, for example, scenario 1 A corresponding channels open, dimming, channel B channel C shutter door, you can simply call scenario 1 through corresponding group address. So, channel A lamp will be opened, the lamp of channel B was transferred to A brightness, channel C shutter door was transferred to A location, of course, this implies A condition, is the three channels of the scene object should be related to the same group address to achieve the above functions.
Each channel can be individually enabled/prohibited scene features, and each channel has eight scenes available. The scene also has learning function, each pass way of scenario learning function can be individually enabled/ban, if can make and call the learning function of A scene, so called scene value will be updated with the value of the current channel.
The value of the scene object is 1 byte.
The following figure shows the options for the scenario functionality in ETS:

The following table illustrates the relevant scenario objects:

| NO. | Name | Length | Use |
| :---: | :---: | :---: | :---: |
| 4 | Scene | 1 Byte | Call of the scene |

For a scenario to be invoked, you simply send the scene value to the appropriate object, with the scenario number range from 1 to 64 , but the actual sending value must be 0-63.
Each channel has eight scenario options, each with a scenario selection range of 1-64.

| Channel A. Scene |  |
| :---: | :---: |
| Save scene | enabled |
| Scene A | Off |
| Scene Number A | $1 \rightarrow$ |
| Scene B | Off |
| Scene Number B | $2 \rightarrow$ |
| Scene C | Off |
| Scene Number C | 3 - |
| Scene D | Off |
| Scene Number D | $4 \longrightarrow$ |
| Scene E | Off |
| Scene Number E | $5 \longrightarrow$ |
| Scene F | Off |
| Scene Number F | $6 \rightarrow$ |
| Scene G | Off |
| Scene Number G | $7$ |
| Scene H | Off |
| Scene Number H | 8 - |

The following table illustrates the value selection of the scenario:

| ETS-Name | Dynamic range [default value] | Remark |
| :---: | :---: | :---: |
| Save scene | Disabled Enabled | Enable/disable learning functions |
| Scene A | $\begin{aligned} & \text { Off } \\ & \text { On } \end{aligned}$ | Activate scenario A |
| Scene number A | 1-64 [1] | Scene; Call value = scenario number-1 |
| Scene B | $\begin{aligned} & \text { Off } \\ & \text { On } \end{aligned}$ | Activate scenario B |
| Scene number B | 1-64 [1] | Scene; Call value = scenario number-1 |
| Scene C | $\begin{aligned} & \text { Off } \\ & \text { On } \end{aligned}$ | Activate scenario C |
| Scene number C | 1-64 [1] | Scene; Call value = scenario number-1 |
| Scene D | $\begin{aligned} & \text { Off } \\ & \text { On } \end{aligned}$ | Activate scenario D |
| Scene number D | 1-64 [1] | Scene; Call value = scenario number-1 |
| Scene E | Off On | Activate scenario E |
| Scene number E | 1-64 [1] | Scene; Call value = scenario number-1 |
| Scene F | $\begin{aligned} & \text { Off } \\ & \text { On } \end{aligned}$ | Activate scenario F |
| Scene number $F$ | 1-64 [1] | Scene; Call value = scenario number-1 |
| Scene G | Off On | Activate scenario G |
| Scene number G | 1-64 [1] | Scene; Call value = scenario number-1 |
| Scene H | $\begin{aligned} & \text { Off } \\ & \text { On } \end{aligned}$ | Activate scenario H |
| Scene number H | 1-64 [1] | Scene; Call value = scenario number-1 |

In order to invoke the scene or save the new value to the scene, you must send the call or save the command to the corresponding scene object:

| Scene | Call |  | Save |  |
| :---: | :---: | :---: | :---: | :---: |
|  | hexadecima | Dez. | Hex. | Dez. |
| 1 | 0 | 0 | 0 x | 128 |
| 2 | 0 | 1 | 0 x | 129 |
| 3 | 0 | 2 | $0 \times$ | 130 |
| 4 | 0 | 3 | $0 x$ | 131 |
| 5 | 0 | 4 | $0 x$ | 132 |
| 6 | 0 | 5 | $0 x$ | 133 |
| 7 | 0 | 6 | $0 x$ | 134 |
| 8 | 0 | 7 | 0 x | 135 |
| 9 | 0 | 8 | $0 x$ | 136 |
| 10 | 0 | 9 | 0 x | 137 |
| 11 | 0 | 1 | 0 x | 138 |
| 12 | 0 | 1 | 0 x | 139 |
| 13 | 0 | 1 | 0 x | 140 |
| 14 | 0 | 1 | 0 x | 141 |
| 15 | 0x0E | 1 | 0 x | 142 |
| 16 | 0xOF | 15 | 0 x | 143 |
| 17 | 0 | 1 | 0 x | 144 |
| 18 | 0 | 1 | 0 x | 145 |
| 19 | 0 | 1 | 0 x | 146 |
| 20 | 0 | 1 | 0 x | 147 |
| 21 | 0 | 2 | 0 x | 148 |
| 22 | 0 | 2 | 0 x | 149 |
| 23 | 0 | 2 | 0 x | 150 |
| 24 | 0 | 2 | 0 x | 151 |
| 25 | 0 | 2 | $0 x$ | 152 |
| 26 | 0 | 2 | 0 x | 153 |
| 27 | 0 | 2 | 0 x | 154 |
| 28 | 0 | 2 | 0 x | 155 |
| 29 | 0 | 2 | 0 x | 156 |
| 30 | 0 | 2 | $0 \times 9 \mathrm{D}$ | 157 |
| 31 | $0 \times 1 \mathrm{E}$ | 30 | 0 x | 158 |
| 32 | 0x1F | 31 | 0 x | 159 |

### 3.5. CORRIDOR LIGHTING

The following parameters are useful only when the channel is selected as a floor lighting function.
3.5.1.OVERVIEW

When a channel is selected for the corridor lighting function, a corresponding submenu will appear to set the parameters.

The following figure shows the parameters that can be set:
Channel B Staircase

| Mode | normaly closed |
| :--- | :--- |
| Time for Staicase [s] | nowarning |
| Warning Time [s] | not activ |
| Prewarning Time in [s] | not activ |
| Manual Switch off | no change |
| Extend Staircase time | no change |
| Central Function | no change |
| Behaviour when locked | no change |
| Behaviour when unlocked |  |
| Behaviour at Bus power up |  |
| Behaviour at Bus power down |  |

The following table shows all the parameters that can be used for floor lighting

| Name | Dynamic range [default value] | Remark |
| :---: | :---: | :---: |
| Mode | normally opened normally closed | Channel mode selection |
| Time for staircase <br> [s] | $\begin{gathered} 0 . . .65535 \mathrm{sec} \\ {[120 \mathrm{sec}]} \end{gathered}$ | Lighting duration |
| Prewarning | not active active | Activate alarm function |
| Warning time [s] | $\begin{gathered} 0 . . .65535 \mathrm{sec} \\ {[120 \mathrm{sec}]} \end{gathered}$ | Warning duration |
| Prewarning time [s] | $\begin{gathered} 0 \ldots . .65535 \mathrm{sec} \\ {[120 \mathrm{sec}]} \end{gathered}$ | Open the duration again |
| Manual switching off | not active active | Enable manual switching off of lighting |
| Extend staircase time | not active active | Enable lighting to last (when the light is on, if you receive the open command again, continue as specified. |
| Central function | not active active | Activate global control |
| Behavior when locked | Off <br> On <br> No change | Controls the action of channel locking |
| Behavior when unlocked | Off On <br> No change | Controls the action when the channel is unlocked |
| Behavior at bus power down | Off <br> On <br> No change | Control the action when the power is off |
| Behavior at bus power up | Off <br> On <br> No change | Control the action of electricity |

### 3.5.2. FLOOR LIGHTING TIME

The following figure shows the lighting time options:
Channel F Staircase

|  | Channel F Staircase |
| :--- | :--- |
| Mode | normaly opened |
| Time for Staircase $[s]$ |  |
| Prewarning | 12 d |
|  | not activ |
|  |  |

The difference between floor lighting and room lighting is that the staircase closes automatically after lighting for a period of time.

The following table shows the communication objects controlling the lighting of the building:

| No. | Name | Length | Use |
| :---: | :---: | :---: | :---: |
| 1 | Staircase | 1 | The floor control invokes <br> the object |

### 3.5.3. PRE-WARNING/CAUTION

The following figure shows the pre-warning/Caution

| Prewarning | activ |
| :--- | :--- |
| Waming Time [s] | 11 |
| Prewarning Time in [s] | 10 |

Warning function can be set parameters "Pre-warning" into "active" can make. Parameters "WarningTime" set the lamp is short temporarily shut down Time, usually set to 1 to 3 seconds, temporarily close the lights can be used to inform the lamp will be closed soon. Parameters "Pre-warning set lamp is once again open to the duration of Time", then the lights will be shut down.

The entire control process of the lamp consists of three parts of time. The following figure shows its composition:

### 3.5.4. MANUAL SWITCH OFF

The following figure shows the manual switch off parameter:

## Manual Switch off

If manual switch off is used, you can close the channel manually without waiting for it to shut down automatically.

### 3.5.5. CONTINUE FUNCTION

The following figure shows the continuation parameters:

If the continuation function is activated, during the opening of the channel, if the opening operation is triggered again, the channel will be retimed; otherwise, the retrigger command is invalid. The following figure illustrates the retrigger mechanism:

### 3.6. WORKING TIME

The working timer can be used to time the cumulative time of the channel's work, and it can also be used to calculate the remaining time from the next service request.

### 3.6.1. WORKING TIMER

The following figure shows the parameters associated with a working timer:

## Channel B Operating hours counter

| Type of operating hours counter | Operating hours counter |
| :--- | :--- |
| Count if | Relay ON |
| Send status of operating hours every I hours | a |

The following table illustrates the parameter selection range of the working timer:

| Name | Dynamic range [default value] | Remark |
| :---: | :---: | :---: |
| Type of operating hours <br> counter | Operating hours counter | Select timing mode |
| Count if | Relay ON | Selective timing condition |
| Send status of operating <br> hours every... hours | $0-100$ <br> $[0 \mathrm{~h}]$ | Set the time interval <br> for automatically returning <br> the time value of the meter. <br> 0 is prohibited. |

The timer can be set to start counting when the channel is open, or when the current is greater than a certain value.
Object "Response operating hours" returns the value of the timer, which is disabled when its parameter value is set to 0 . Object "Reset operating hours" is used to reset the value of the timer.

The following table illustrates the relevant timing objects:

| NO. | Name | Length | Use |
| :---: | :---: | :---: | :---: |
| 8 | Response operating hours | 2 Byte | Sending time value |
| 9 | Reset operating hours | 1 Bit | Set the timer value to 0 |

### 3.6.2. COUNTDOWN TIMER

The following figure shows the parameters associated with the countdown:

|  | Channel B Operating hours counter |
| :--- | :--- |
| Type of operating hours counter | Reverse counter |
| Count if | Relay ON |
| Send status of service hours every I h$]$ | d |
| Send signal of service al I $\times 10 \mathrm{~h}$ intervals | 0 |

The following table illustrates the parameter setting options related to the countdown:

| ETS-Name | Dynamic range [default value] | Remark |
| :---: | :---: | :---: |
| Type of operating hours <br> counter | Reverse counter | Countdown mode |
| Count if | Relay ON | Timing conditions |
| Send status of service <br> hours every ... [h] | $0-100$ <br> $[0 h]$ | Set the sending status <br> message cycle |
| Send signal of service <br> at ...x10h intervals | $0-250$ <br> $[0 h]$ | Set the service request cycle |

The "Send signal of service at" parameter is used to set the interval between sending a service request and, when set to 0 , to disable the function.
"Send status of service hours every..."Is used to set the cycle time of the sending state service. When set to 0 , it is forbidden this function.

The following table shows the countdown related objects:

| NO. | Function | Length | Use |
| :---: | :---: | :---: | :---: |
| 8 | Time to the next service | 2 Byte | Send the remaining time from the next |
| 9 | Reset service | 1 Bit | Reset timseervtioceset value |
| 10 | Service required | 1 Bit | Request a service |

### 3.7. INPUT CHANNEL CONFIGURATION

The following figure shows the channel mode selection:

| Function Input Type A / B | O Channels unique Channels grouped |
| :---: | :---: |
| Function Input A | $\bigcirc$ disabled enabled |
| Function Input B | $\bigcirc$ disabled enabled |
| Function Input Type C / D | O Channels unique Channels grouped |
| Function Input C | $\bigcirc$ disabled enabled |
| Function Input D | $\bigcirc$ disabled enabled |

Functional specifications:

| The parameter Name | Dynamic range <br> [default value] | Remark |
| :---: | :---: | :---: |
| Function Input Type <br> A/B, C/D | Channels unique <br> Channels grouped | Channel working mode: <br> Channels unique means the channel <br> works in independent mode. <br> Channels grouped means that <br> Channels work in combination mode. |
| Function Input A, B, C, D; <br> Function Input A/B, C/D | disabled <br> enabled | Disabled means the channel is not <br> working; |

### 3.7.1. THE INPUT CHANNEL IS CONFIGURED WITH THE SAME PARAMETERS

### 3.7.1.1. Blocking Object

Each channel can activate the blocking function, and each channel function has its own blocking object.

The following is the object description:

| NO. | Name | Length | Use |
| :---: | :---: | :---: | :---: |
| 84 | Blocking object | 1bit | When the value 1 is received, the channel is blocked <br> (the channel will no longer generate any action) and <br> the value 0 returns to normal |

### 3.8. COMPOSITE PATTERN PARAMETER CONFIGURATION

The following table is the group mode parameter option:

| Parameter Name | Dynamic range <br> [default value] | Remark |
| :---: | :---: | :---: |
| Input A/B | Dimming <br> Shutter <br> Switch | Work mode selection: dimming, curtain, <br> switch |
| Dimming function A/B | Brighter/Darker <br> Darker/Brighter | Set the dimming mode, the former is A, <br> the latter is B |
| Shutter function A/B | Up/Down <br> Down/Up | Set curtain control, the former is A, <br> the latter is B |
| Switch function A/B | On/Off <br> Off/On | Set the switch mode, the former is A, <br> the latter is B |
| Blocking Object | Inactive <br> Active | Set the blocking function and disable <br> by default |

When selecting composite mode, the adjacent two channels will be configured to combine functions.

### 3.8.1. DIMMING CONTROL

The two-key dimming function works in combination mode. The following figure is the parameter option:

|  | Input A /B |
| :--- | :--- |
| Input A /B | Dimming |
| Dimming Function A /B | Brighter/Carker |
| Blocking Object | Inactive |
|  |  |

Parameters Description:

| NO. | Name | Length | Use |
| :---: | :---: | :---: | :---: |
| 80 | Dimming on/off | 1-bit | Switch function, short button effective. |
| 81 | Dimming | 4-bit | Dimming function, long button effective. |

When a set of channels is configured with dimming function, two objects will appear, one 1-bit object corresponding to the short button, used to control the opening and closing, and one 4-bit object corresponding to the long button, used to control the dimming.
Brighter/part or part/Brighter optional configuration, the former corresponds to the first input, the latter corresponding to the second input.
For example: A channel to be Brighter/part $A / B$, the channel $A$ is the bright, channel B is dim. Short key channel A direct lights, channel B, shut the lights directly. Long keys, channel A move bright light according to the set time is slow slow channel B dim the lights. Long keys that move light, midway at any time to loosen keystrokes, stop that move light, light to keep the current brightness, light will continue to be from when former brightness starts to adjust The brightness will not change when the brightness reaches the maximum or minimum.

The picture below shows two channels of dimming:

| Input A / B | Shutter |
| :--- | :--- |
| Shutter Function A/B | Up, Down |
| Operation function | Long=ave / short=stop/slats |
| Blocking Object | Inactive |
|  |  |

When curtain of channel $A / B$ is configured to control, and parameter selection Up/Down, the long press A button, the device will send A signal, the curtain will move Up, long press B button, the device will send A 1 signal, the curtain will move Down. Short press A or B will be sent to stop signals. If the parameter selection Down/Up, the function of $A / B$ swap. If the operation mode selection for short $=$ move/long $=$ stop/slats, the short keys that move light, long button to stop.

### 3.8.2. SWITCH CONTROL

Switch control can be realized when two channels are configured in switch mode.

|  | Input A / B |
| :--- | :--- |
| Input A / B | Switch |
| Switch function A /B | on / off |
| Blocking Object | Inactive |

When channel $\mathrm{A} / \mathrm{B}$ is configured in combination switch mode and the parameter On/Off is selected, press $A$ to send 1 signal and press $B$ to send 0 signal.

### 3.9. INDEPENDENT SCHEMA PARAMETER CONFIGURATION

7 functions can be selected when the channel works:
Switch
Switch short/long
One button dimming
One button shutter
Counter
Scene
LED output
Where Inactive is the channel disabled, the parameters corresponding to the channel are no longer displayed.

### 3.9.1. SWITCH

The switch function can respond to different key movements (press down, release) and delay sending function.
When a sub-option is selected, will appear more other parameter options, see the following sections for parameter description.
The switch function options are as below:

3.9.1.1. Switch Falling Edge/Rising Edge/Both Edge

Edge configuration parameter table:

| Parameter Name | Dynamic range [default value] | Remark |
| :---: | :---: | :---: |
| Value for rising/ <br> falling edge | On | Open/close at will with press/ |
| release |  |  |

When the channel selects the edge delay Switch rising edge or Switch falling edge, an On or Off signal is sent under the corresponding action.
The following figure shows the effect of channel configuration as Switch rising edge to send On signal:

The following table is the corresponding communication object:

| NO. | Name | Length | Use |
| :---: | :---: | :---: | :---: |
| 80 | Switch | 1-bit | Press the button to send the corresponding <br> signal, long press/short press will not affect. |

### 3.9.1.2. Toggle rising/falling edge

The channel can be configured to toggle up (press down) or down (release) the toggle output. Each toggle is based on the last State feedback, which means that the Value for toggle must be associated with the target State object to work properly.

The following figure shows the channel configured with drop delay (release) and toggle function:

The following table is the corresponding communication object:

| NO. | Name | Length | Use |
| :---: | :---: | :---: | :---: | :---: |
| 80 | Switch | 1-bit | Press the button to send the corresponding signal, long <br> press/short press will not affect. |
| 81 | Value for toggle | 1-bit | Connect the status object, which reflects the current <br> state of the target, for the toggle function. |

Object Value for toggle is related to the normal implementation of the toggle function, so it must be connected to the state object of the target channel. If there is no target object, it should be connected to the Switch object of this channel.

### 3.9.1.3. Send Status

When the channel is configured as a Switch and the Send Status function, the channel can send the set value in the ascending or descending delay. The configuration diagram is shown below:

| Function | Switch |
| :--- | :--- |
| Subfunction | Send Status |
| Value for risinge edge |  |
| Value for falling edge | On |
| Blocking Object | Inactive |
| Behaviour at Bus power up |  |
| Send cyclic activ | send nothing |
|  | Off |

Parameter Description:

| Parameter Name | Dynamic range <br> [default value] | Remark |
| :---: | :---: | :---: |
| Value for rising edge | On <br> Off | Send a signal when pressed |
| On |  |  |
| Off |  |  |$\quad$| Send a signal when released |
| :---: |

Object Description:

| NO. | Name | Length | Use |
| :---: | :---: | :---: | :---: |
| 80 | Switch | 1 -bit | Send switch value, the length of the button <br> is no difference. |

The Send Status function can be used to perform some special functions, such as detecting the closed state. For example, when the window is opened and closed, the Send Status function can be used to send the window state for monitoring when the window is installed with a transmitting point.

The following figure shows that press send 0 signal, release send 1 signal:

3.9.1.4. Send Value Rising/Falling/Both Edges

There are two values that can be sent, a 1 byte, and a 2 bit, depending on your choice.
Parameter:

| Function | Switch |
| :--- | :--- |
| Subfunction |  |
| Value (1Byte) / forced setting (2Bit) | 1 Byte value both edges [1Byte / 2Bit) |
| Value for risinge edge | 0 |
| Value for falling edge |  |
| Behaviour at Bus power up | send nothing |
| Blocking Object | Inactive |

The following table is a 1 byte value parameter:

| Parameter Name | Dynamic range [default value] | Remark |
| :---: | :---: | :---: |
| Value for rising/ <br> falling edge | $0-255$ | Sends a 1-byte value at the set <br> margin (up, down). |

For 1-byte objects, it can send any value in the range of 0-255, depending on your Settings.

The following is the object description:

| NO. | Name | Length | Use |
| :---: | :---: | :---: | :---: | :---: |
| 80 | Send value | 1-bit | Send setting value |

The following table shows the 2-bit value parameters:

| Parameter Name | Dynamic range [default value] | Remark |
| :---: | :---: | :---: |
| Send forced setting <br> at rising/falling | Forced setting not active <br> Forced setting off <br> Forced setting on | Send a 2-bit value at the set <br> margin (up, down). |

This 2-bit object can be used for some purposes, such as human induction automatic control. The parameters are as follows:

Forced setting not active (control $=0$, value $=0$ )
Forced setting off(control=1, value=0)
Forced setting on(control=1, value=1)
2-bit value object:

| NO. | Name | Length | Use |
| :---: | :---: | :---: | :---: |
| 80 | Send forced setting | 2-bit | Send setting value. |

### 3.9.1.5. Send Value with On/Off Delay

The following table shows the delay sending parameter description:

| Parameter Name | Dynamic range [default value] | Remark |
| :---: | :---: | :---: |
| Delay time | $0-60 \mathrm{~min}$ <br> $[1 \mathrm{~s}]$ | Send value after time delay <br> setting |

To send sub-function value with on/off delay, is send on or off value, delay some time before we send. If prior to the completion time delay, the channel back to the previous state, the time delay end ahead of time, and do not send values For example, channel press, send delay 3 seconds on value, and before the time arrived, channel was released, the channel delay end, no longer send on value.

The following figure shows the operation:

## Parameters:

| Function | Switch |
| :--- | :--- |
| Subfunction | Send Status with off-delay |
| Delay time | 1 s |
| Blocking Object |  |
|  | Active |

Object description:

| NO. | Name | Length | Use |
| :---: | :---: | :---: | :---: | :---: |
| 80 | Switch | 1-bit | Press delay to send On value, release delay to send Off value. |

### 3.9.2.SCENE

Scene function can be used to control multiple channels of one or more executors to achieve a scene state. In addition, in the case of activating learning function, learning commands can be sent through long buttons.

The following figure shows the parameter configuration:

| Function | Scene |
| :--- | :--- |
| Subfunction | Save |
| Scene Number |  |
|  |  |
| Blocking Object |  |
|  |  |

The following table shows the parameter description:

| Parameter Name | Dynamic range <br> [default value] | Remark |
| :---: | :---: | :---: | :---: |
| Saving function | No save <br> Save | When saving is enabled, the long button <br> can learn and save the current channel value. |
| Scene number | $1-64$ <br> $[1]$ | The scenario number must be configured to be <br> the same as the executor. |
| Blocking object | Inactive <br> Active | Block the object, forbidden by default. |

## Object description:

| NO. | Name | Length | Use |
| :---: | :---: | :---: | :---: |
| 82 | Scene | 1-bit | Send scene value |

When the short button is pressed, the set scene number is sent, and the executor scene object with the same set of addresses will receive the scene number and perform the corresponding action. When the learning function is activated, a learning command will be sent to the associated executor through the long button, and the executor will save the current channel state to the corresponding scene number.

The following table sends and saves the corresponding values for the scenario:

| Scene Send | Save |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Hex. | Dez. | Hex. | Dez. |
| 1 | $0 \times 00$ | 0 | $0 \times 80$ | 128 |
| 2 | $0 \times 01$ | 1 | $0 \times 81$ | 129 |

### 3.9.3.COUNTER

You can count the number of switches using the counter function. You can configure the up delay count, down delay count, or up and down delay count.

The following figure shows the parameter description

The following figure shows the parameter description:

| Parameter Name | Dynamic range <br> [default value] | Remark |
| :---: | :---: | :---: | :---: |
| Sub-function | Count rising <br> Count falling <br> Count rising and falling | In setting the edge delay count, upper <br> and lower delay count by default |
| Sending difference | $0-65535$ <br> $[5]$ | The current value is sent for each <br> increment in the count. |
| Blocking object | Inactive <br> Active | Blocking function |

Object description:

| NO. | Name | Length | Use |
| :---: | :---: | :---: | :---: |
| 80 | Reset Counter | 1-bit | Reset counter |
| 83 | Counter | 4-byte | Output counter value |

If the delay count is set as up/down, the sending interval is 5 , then the delay count will be raised once, the delay count will be decreased once, the current count value will be sent when the count reaches 5 , and the count value will be sent again when the count reaches 10 , and so on.
The communication object counter reset is used to reset the counter value to 0 , and the object value 0.1 is valid.

The following figure shows the up/down delay count, sending interval 5 :

### 3.9.4. SWITCH SHORT/LONG

Long press/short press can be independently assigned as on/off/flip/send value, etc.

The following figure is the parameter option:

| Function | Switch shot/long |
| :--- | :--- |
| Value for keystroke short - Object 1 |  |
| Value for keystroke long - Object 2 | On |
|  |  |

The following table shows the parameter description:

| Parameter Name | Dynamic range <br> [default value] | Remark |
| :---: | :---: | :---: |
| Value for keystroke <br> short object 1 | On <br> Off <br> Toggle <br> Send value <br> Nothing | Apply to short buttons |
| Value for keystroke <br> long object 2 | On <br> Off <br> Toggle <br> Send value <br> Nothing | Apply to long buttons |
| Blocking object | Inactive <br> Active |  |

The following table is the object description:

| NO. | Name | Length | Use |
| :---: | :---: | :---: | :---: |
| 80 | Push-button short | 1-bit | Object for short buttons |
| 81 | Value for toggle short | 1-bit | Short button toggle value |
| 82 | Push-button long | 1-bit | Object for long buttons |
| 83 | Value for toggle long | 1-bit | Long button toggle value |

Single bond length of the keyboard to control the two channels are available, and it can save a button. Press open or short, long press, you can also short according to toggle, long press to toggle, etc. When configured to toggle function, must be control to turn the corresponding object is connected to the channel of actuators on the state of the object, in order to realize the right turn.

As shown in the following figure, long/short press is set to toggle function, long press control executor channel A, short press control channel B:

The following picture shows the long/short press used together, long press open, short press close:

The following table shows the parameter description for selecting the function Send value:

| Parameter Name | Dynamic range <br> [default value] | Remark |
| :---: | :---: | :---: | :---: |
| Value for keystroke <br> short/long | Send value | The sub-function is selected as the <br> send value |
| Send value | 1 Byte-Value[0...255] <br> Scene number | Value selection: one is a 1-byte <br> unsigned value, the other is a scene <br> value. |
| 1 Byte-Value[0...255] | $0-255$ <br> $[0]$ | A byte of unsigned values ranging from <br> 0 to 255. It can be used for controls <br> such as absolute dimming |
| Scene number | $1-64$ | One bite scenario value, ranging from <br> 1 to 64. It can be used for scenario <br> control. |

### 3.9.5. ONE BUTTON DIMMING

Single key to achieve dimming, on/off.
The following figure is the parameter option:

| Function | One Button Diming |
| :--- | :--- |
| Blocking Object | Inactive |
|  |  |

Parameter description:

| Parameter Name | Dynamic range <br> [default value] | Remark |
| :---: | :---: | :---: |
| Blocking object | Inactive <br> Active | Blocking function |

Object description:

| NO. | Name | Length | Remark |
| :---: | :---: | :---: | :---: |
| 80 | Dimming on/off | 1-bit | With the same switch function, the short <br> button is effective every time. |
| 81 | Dimming | 4-bit | The long button is effective for light <br> adjustment. |
| 82 | Value for toggle | 1-bit | Receive channel status values. |

Single bond dimmer can achieve on/off, dimming function. Short key and switch function is the same, every button to flip. Long keys to realize relatively light, reaches the maximum/minimum brightness change, no longer release button to stop the dimming. Because it is a single bond dimmer, so every time long keys that move light change direction. Assuming that the current dimmer upwards, the direction of the next move light downward. The lithography degree 100\% every time.

The following figure shows the dimming instructions:

### 3.9.6. ONE BUTTON SHUTTER

Single key curtain control.
The following figure is the parameter:

| Function | One Button Shutter |
| :--- | :--- |
| Operation function | Long=sove/short=stop/slats |
| Blocking Object |  |
|  | Inactive |

Parameter description:

| Parameter Name | Dynamic range <br> [default value] | Remark |
| :---: | :---: | :---: |
| Blocking object | Inactive <br> Active | Blocking function |

Object description:

| NO. | Name | Length | Use |
| :---: | :---: | :---: | :---: |
| 80 | Shutter | 1-bit | The curtain moves and the long button <br> is effective. |
| 81 | Blinds/Stop | 1-bit | The curtain stops. The short button <br> works. |
| 82 | Value for change <br> of direction | 1-bit | Indicates the current direction. |

Long buttons control curtain movement, changing direction each time, assuming current upward movement, then next downward movement. Short buttons send a Stop command through the object Blinds/Stop.

## 4. LED OUTPUT

The following figure is the LED parameter configuration diagram:

| Function | LED output |
| :--- | :--- |
| LED state at objectvalue $0 / 1$ | OFF/ON (normaly) |
| LED state at ON | Pernanent |
| Behavior of LED at undefined object | OFF |

Parameter description:

| Parameter Name |  | Dynamic range [default value] | Remark |
| :---: | :---: | :---: | :---: |
| LED state at object value 0/1 |  | OFF/ON(normal) ON/OFF(inverted) | Indicates how the LED responds to the object value. |
| LED state at ON |  | Permanent blinking | Indicates the luminescence mode, always on/flashing. |
| Behavior of LED at undefined object |  | OFF <br> Short flash | Define the LED state when the LED object has no valid value. |
| LED object: |  |  |  |
| NO. | Name | Length | Use |
| 122 | LED Output A | 1-bit | Control LED output |

LED output function can directly drive external LED without additional electronic components. The output voltage is 3.3 v , which is integrated with 1 k current limiting resistance.
The LED can normally respond to the object value ( $1=$ open, $0=$ close), or reverse display ( $0=$ open, $1=$ close). It can also configure the LED lighting mode, which is always on/flashing.

### 4.1. LOGIC

Device extension input contains two logical control blocks. Various input/output modes can be configured.
Parameters of the figure:

| Behaviour at Bus power up | (0) no read ext. logic objekts |  |
| :---: | :---: | :---: |
|  | (- read ext. logic |  |
| Settings for logic 1 | And | - |
| Objecttype 1 | Switch | - |
| Sending condition | not automatic | - |
| Output inverted | - No Yes |  |
| Settings for logic 2 | Or | - |
| Objecttype 2 | Switch | - |
| Sending condition | not automatic | - |

Parameter description:

| Parameter Name |  |  | range <br> value] | Remark |
| :---: | :---: | :---: | :---: | :---: |
| Behavior at bus power up |  | No read ext.logic objects Read ext.logic objects |  | Specifies whether the logical object values are read when the device is powered on. When configured to read on, the device reads and updates the value of the external logical object, otherwise the default value is 0 . |
| The following table is function selection: |  |  |  |  |
| Setting per logic [default value] |  | Dynamic range [default value] |  | Remark |
| Disabled And Or |  | Switch <br> Scene <br> 1 byte value |  | Logical objects can be configured as And/ Or operations, And optional functions include switch/scene/1 byte value. |
| Object description: |  |  |  |  |
| NO. | Name |  | Length | Use |
| 110 | Logic input 1A |  | 1-bit | External logical input object, effective when activated. |
| 111 | Logic input 1B |  | 1-bit | External logical input object, effective when activated. |
| 112 | Logic output 1 |  | 1-bit | Logical output object, activate switch function when valid. |

There are two sets of logical objects in total, and the remaining sets of objects numbered 113 to 115 are functionally the same.
When a logical block is activated, a new parameter configuration box will appear. More parameters can be selected. Two external logical objects can choose whether to be activated or not, and the corresponding object can configure the group address after activation.

The following figure shows the input options, including two external logical objects and four channels:

| Logical object 1 A (external) | disabled |
| :--- | :--- |
| Logical object 1 B (external) | disabled |
| Input A | disabled |
| Input B | disabled |
| Input C | disabled |
| Input D | disabled |

### 4.1.1. LOGIC OBJECT TYPE SWITCH

| The following table is the parameter description: |  |  |
| :--- | :--- | :--- | :--- | :--- |
| Parameter Name | Dynamic range <br> [default value] | Remark |
| Send condition | Not automatic <br> Change of input <br> Change of output | Set output conditions |
| Output inverted | No <br> Yes | Sets whether the output is reversed |

For the sending condition change of input, the output state will be changed when any activated input state changes.
For the sending condition change of output, the output state will be different only when all input signals have a set logical operation and the resulting state is different from the previous one.
As for the reverse output function, it means that when the result of the logical operation is 0 , output 1 is 1 , and output 0 is 1 .

The following figure shows the signal description. The logical function is configured with Switch, And operation, activation channel A/B, And an external logical object. The output is reversed:

In the figure above, only when all three inputs are 1, the result of And operation is 1 , the output after reverse is 0 , And the output at other times is 1 .

### 4.1.2. LOGIC OBJECT TYPE SCENE

After configuring the logical block into the scene function, when the logical operation result is 1 , the set scene value is output, and the scene value is only output once when the logical operation result is changed from 0 to 1 each time.

The following table shows the parameter description:

| Parameter Name | Dynamic range <br> [default value] | Remark |
| :---: | :---: | :---: |
| Scene number | $1-64$ <br> $[2]$ | Scenario number Settings |

4.1.3.LOGIC OBJECT TYPE BYTE VALUE

The following table is byte value parameters:

| Parameter Name | Dynamic range <br> [default value] | Remark |
| :---: | :---: | :---: |
| Byte value[0...255] | $0-255$ <br> $[0]$ | Sent byte values. |

As with the scenario function, as long as the logical operation results in 1, the set byte value is output once.
